# 

# Failure to observe the following instructions may result in serious injury or death!

There is a risk of electric shock during installation! Therefore, electrical devices may only be installed, operated, serviced and maintained by qualified professionals. A professional is someone who has the ability, experience and knowledge required for the construction, installation and operation of electrical equipment and who has been instructed in identification and avoidance of possible hazards.

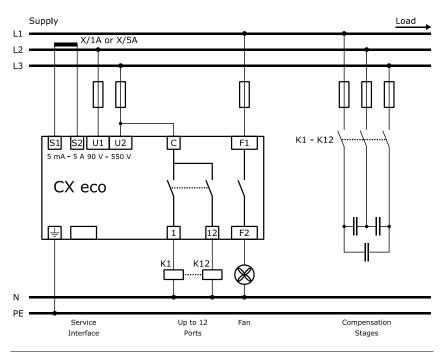

During installation and maintenance, the relevant regulations for the installation of switchgear and accident prevention must be observed and adhered to.

Devices with damaged or open housings or terminals must not be operated on the power grid and must be disconnected immediately.

After disconnecting the device, 10 minutes must be waited until the capacitors have been discharged. Subsequently, doors or covers may be removed. It must be checked whether the disconnected area is voltage-free using a standardized measuring instrument.

Ther BELUK GmbH assumes no responsibility or warranty for damage to persons and equipment caused by improper installation and use.

## **Connection diagram**

**NOTE:** The CX eco is designed to control **capacitive or inductive** stages. Operating both stage types simultaneously is not possible.

## Installation and commissioning

- 1) Before installation, the connection specifications of the CX eco must be compared with the data of the power grid.
- 2) Disconnect the power supply and secured the working area against unauthorized and unintentional reconnection. Check if the disconnected area is voltage-free using a standardized measuring instrument. The voltage-free system must be earthed and short-circuited. Neighboring live parts must be covered and/or bypassed.
- 3) The current transformer must be short-circuited. A current transformer which has not been short-circuited generates a life-threatening voltage. This can lead to a destruction of the current transformer.
- 4) Insert the CX eco into the panel cut-out and fix it by using both fixing clamps.
- 5) Connect the grounding cable to the intended terminal on the backside of the device.
- 6) All cables must be connected as it is depicted in the connection diagram. The terminal K of the current transformer must be connected to terminal S1 and the terminal L to terminal S2.
- 7) Remove the short-circuit bridge at the current transformer.
- 8) The voltage can now be switched on.

and all symbols will be displayed during a display test.10) Now, the current transformer factor must be entered.

9)

If the device is connected correctly, the display will light up for one second

11) If necessary, the nominal voltage and the voltage transformer factor must be adjusted.

12) The Automatic initialization (Ai) must be started (SETUP/100/Ai or

- SETUP/207 = **YES**).

  13) After a successful Automatic initialization, the **AUTO** symbol appears in
- the displayed. When the discharge time has elapsed, the automatic control starts.

## Frequently asked questions during commissioning

- AUTO is not shown → control is switched off
  Possible reasons: Manual operation activated; control is switched off;
  temperature is too high; current is less than 5 mA; voltage or THD of the
  voltage are inadmissible
- 2) U ALARM is shown → voltage is out of tolerance Possible reasons: Nominal voltage (SETUP/Un) or voltage transformer factor is set incorrectly (SETUP/Pt)
- 3) I Lo ALARM is shown → measuring current is smaller than 5 mA Possible reasons: Connection from the current transformer to the controller is incorrect; the current transformer jumper was not removed; current transformer ratio is too large; no current flow
- 4) EXPORT is shown → reverse current flow Possible reasons: If there is no real reverse current flow, the voltage or current measurement is incorrect (phase, polarity)
- 5) Wrong cos φ is shown → incorrect connection Possible reasons: Voltage or current measurement is incorrect (phase, polarity)
- 6) Outputs are immediately switched off Possible reasons: Stage sizes in the stage database are incorrect
- 7) Frequent switching operations
   Possible reasons: Capacitor capacity have not been recognized yet

## Display

**EXPORT** 

INFO AUTO MANUAL SETUP ALARM

ALARM

**AUTO** or

no display: Measurement menu

**INFO:** Stage database

**AUTO:** Control is on (no menu item)

MANUAL: Manual mode SETUP: Controller settings

ALARM: Alarm memory

**EXPORT:** Reverse current flow

**ALARM:** Flashes if an alarm is pending

8.8 B<sub>ic</sub>

First line

**1:** Power factor  $\cos \phi$  / Menu item

2: Inductive i / capacitive c

1: Abbreviations

2: Measurement values / alarm codes

3: Units

Stage outputs

Stage status: On, off, faulty (flashing)
Stage data base: Selected stage flashes

12345678910111213

## **Operation concept**

- 1 Exit menu
  - Move cursor to the left
  - Reset alarm (push for 3 s)
- 2 Decrease value
  - Select next value, menu or stage number
- 3 Increase value
  - Select previous value, menu item or stage number
- 4 Open menu
  - Move cursor to the right
  - Accept value

## **Entering values**

If a menu item has been entered, the first digit of the current value flashes. Numbers can be increased or decreased by pushing the  $\triangle$  and  $\nabla$  keys.

The next digit can be selected by pushing the  $\blacktriangleright$  key. In order to select the previous digit, the  $\blacktriangleleft$  key must be pushed.

If the last digit (right) has been selected and the  $\blacktriangleright$  key is pushed again, a multiplier  $\mathbf{k}$  (kilo) or  $\mathbf{M}$  (mega) can be set using the  $\blacktriangle$  and  $\blacktriangledown$  keys. To accept the value and complete the entry, the  $\blacktriangleright$  key must be pushed again.

If an entered value has not been accepted, or if another value is displayed after an input, the entered value has exceeded or fallen below the threshold of the setting range.

An entry can be canceled at any time by pushing the ◀ key. Depending on the actual position, the ◀ key must be repeatedly pushed until the first digit (left) is selected. Pushing the ◀ key again exits the menu item without accepting changes.

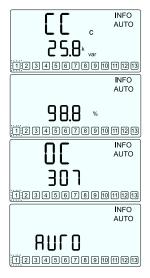

#### Main menu

A menu can be selected by pushing ▲▼; Submenus are entered with ▶

Measurement menu (Using ▲▼)  $\mathsf{NPR}$ AUTO Retrieve measured values INFO INFO - Stage database 0.98 AUTO Contains the reactive power, power losses, amount of switching cycles and operating hours, stage type of each stage MANUAL - Switching stages manually  $\mathsf{NPR}$ Switching stage outputs manually SETUP - Controller setup  $\mathsf{NPR}$ AUTO Show and adjust all controller settings SETUP ALARM - Alarm memory  $\mathsf{N}\mathsf{Q}\mathsf{R}$ AUTO Show the last 10 alarm messages. The newest alarm message is saved in location 1. ALARM

## **INFO – Stage database**

Stages can be selected by  $\blacktriangle \blacktriangledown$  and entered by pushing  $\blacktriangleright$ . The selected stage flashes. Using  $\blacktriangle \blacktriangledown$ , the following information can be shown.

#### **Current capacitor size**

The reactive power value refers to the nominal voltage

#### Capacitor size in percent

Current reactive power to nominal reactive power ratio

#### Amount of switching cycles

Amount of completed switching operations

#### Stage type

**AUTO:** Stage is controlled automatically

**FON:** Stage is always on **FOFF:** Stage is always off

Flty: Stage has been detected as faulty

#### **Operating hours**

Amount of operating hours

## MANUAL – Switching stage outputs manually

In order to enter the MANUAL menu, the ▶ key must be pushed for 3 seconds.

▲▼ to select a stage. The selected stage is shown in the lower part of the display. A stage is switched on or off by pushing the ▶ button.

#### Important information:

- Only stages of the type AUTO can be manually switched.
- The discharge time is considerd in manual mode as well. After switching a stage off, it is locked until the discharge time has been expired.
- The measured voltage must be within the set tolerance. If the voltage is out of tolerance, every stage is switched off and cannot be switched on again.
- As soon as the MANUAL menu is left, the control automatically starts again.

## SETUP – Controller setup

The Quick Start menu (100) and the Expert menus (200 – 800) can be entered by pushing the ▶ button. The latter one requires the input of a PIN code.

Un	Nominal voltage
Ct	Current transformer factor
Pt	Voltage transformer factor
Ai	Automatic initialization The phase angle between voltage and current is determined and which stage outputs are used.

- PFC Control ON, OFF, Hold
  Switching on, off or suspend the control
- CP1 Target-cosφ 1
  Compensation target
- St Switching time
  Delay between switching different stages
- Out Stage type AUTO, FON, FOFF, Flty
  Stages are controlled automatically, are peramanetly on, permanently off or detected as faulty. AUTO, FON and FOFF can be adjusted and Flty stages can be reset.

## **Automatic initialization (Ai)**

The Automatic initialization determines the phase angle between voltage and current and detects which stage outputs are used.

The Automatic initialization can be activated in the SETUP menu (SETUP/100/Ai or SETUP/207 = YES) and starts as soon as the voltage is within the tolerance and the measured current is greater than 5 mA. The display shows Ai run and the number of the active run. At the end of the Ai, the function of the controller must be checked.

**NOTE:** The Automatic initialization is only possible in conjunction with capacitive stages.

Due to load fluctuations, it may happens that the Ai does not correctly recognize used stage outputs or is aborted. The latter one is displayed by the error message **Ai / Abrt**. In this case, the control is stopped.

If the Automatic initialization is not successful after several attempts, the correct phase correction angle must be set manually (SETUP/206). Moreover, the stage types must be adjusted manually (SETUP/100/Out or SETUP/403) and the control must be started again (SETUP/100/PFC or SETUP/310 = **ON**).

## Automatic stage size detection

If stage detection is activated (SETUP/308 = YES), the CX eco determines the size of the stages automatically during each switching operation. The detected sizes are stored in the stage database. There, a stage power loss can be monitored.

If the controller cannot detect a power grid reaction during the first three switching operations, the stage type of the affected stage is set to **FOFF** and it is not taken into account by the control.

**NOTE:** The automatic stage detection is only possible in conjunction with capacitive stages. The use of inductive stages requires a manual input of the stage sizes (SETUP/402).

## **Detect faulty stages**

Stages whose size has already been adopted are classified as faulty by the control system after three successive switching operations without a power grid reaction. A new check is performed after 24 hours.

Faulty stages have the stage type **Flty** and are indicated by a flashing stage symbol.

The cause of a faulty stage could possibly be a defective fuse, a defective power contactor or a defective capacitor stage.

## **Most important Alarm and Error messages**

U	ALARM	The measured voltage is out of the set tolerance.
l Lo	ALARM	The measured current is smaller than 5 mA.
l hi	ALARM	The measured current is higher than 6 A.
PFC	ALARM	The compensation target cannot be reached.
HArU	ALARM	Set THD voltage threshold exceeded.
HArl	ALARM	Set THD current threshold exceeded.
StEP/FltY	ALARM	At least one stage is faulty.
SPL/Nr	ALARM	The reactive power of at least one stage has fallen below 75 % of the initial power value.
thi	ALARM	Second temperature threshold exceeded.
OPh	ALARM	Operating hours of the controller exceeded.
OPC/Nr	ALARM	Switching cycles of at least one stage exceeded.
OPh/Nr	ALARM	Operating hours of at least one stage exceeded.
SYS/004F	ALARM	A system alarm is triggered. The device is defective and must be returned to BELUK GmbH.
Ai/Abrt	ALARM	The Automatic initialization has been aborted due to an error. The control is switched off.

## **Specifications**

	<del>-</del>		
Voltage measurement /	Connection: Single phase		
supply:	Range: 90 – 550 V AC, 45 – 65 Hz		
	Protection: Max. 6 A		
	Power consumption: 6 VA		
	Transformer factor: Adjustable 1.0 350.0		
Current measurement:	Connection: Single phase		
	Range: 5 mA – 5 A		
	Transformer factor: Adjustable 1 9600		
Stage outputs:	6 or 12 Stage ouputs		
	Type: Relay, normally-open, potential-free		
	Supply: Common, max. 10 A		
	Swit. capacity per relay: 250 V AC / 5 A		
	400 V AC / 1 A		
	48 V DC / 1 A		
	110 V DC / 0.2 A		
Temperature	Type: NTC under the housing cover		
measurement:	Accuracy: +- 5 °C		
Fan output:	Type: Relay, normally-open, potential-free		
·	Switching capacity: 250 V AC / 5 A		
	400 V AC / 1 A		
	48 V DC / 1 A		
	110 V DC / 0.2 A		
Service Interface:	For service purpose only		

•	'
	Storing: -40 °C – 85 °C
Humitdity:	Range: 0 % – 95 %
	Condensation: Not allowed
Overvoltage category:	300 V <sub>LN</sub> / 519 V <sub>LL</sub> → CAT III
	519 V − 550 V → CAT II
	Degree of contamination → 2
Standards:	IEC 61010-1, IEC 61000 6-2,
	IEC 61000 6-4: Level B, IEC 61326-1, UL 61010
Compliance and Listing:	CE, c NRTL us (c UL us), EAC
Connections:	Type: Screw terminals, pluggable
	Cross section: Max. 4 mm <sup>2</sup>
Housing:	Front: Plastic housing (UL94 V-0)
	Back: Metal cover
Protection class:	Front: IP41
	Back: IP20
Weight:	Approx. 0,6 kg
Dimensions:	Device: H x B x T: 144 x 144 x 58 mm
	Cut-out: H x B: 138 (+0,5) x 138 (+0,5) mm

Ambient temperature: Operating: -20 °C – 70 °C
